Introduction to (01A) Wavelet Coding, and (01B) JPEG2000

Guido T.G. Volleberg & Peter H.N. de With
(p.h.n.de.with@tue.nl)

TU/e PdW-SZ-EB / 2016 Fac. EE SPS-VCA Adv. Topics MMedia Vid. Cod. / 5LSH0 / Module 01A Wavelets 

Overview

2

- * **A1: Wavelet transform**
 - Introduction and Fourier analysis
 - Subband filters, Quadrature Mirror Filters
 - Wavelets
- * **A2: Wavelet video coding**
 - Wavelet coefficient coding for compression
 - Intraframe and interframe coding
- * **B: JPEG2000 standard**
 - Standard principles
 - Special coding modes, forms of scalability

TU/e PdW-SZ-EB / 2016 Fac. EE SPS-VCA Adv. Topics MMedia Vid. Cod. / 5LSH0 / Module 01A Wavelets 

3

Module 01A (a): Introduction to Wavelet Theory

Fourier analysis, STFT, Wavelet and Scaling functions, Filter banks

TU/e PdW-SZ-EB / 2016 Fac. EE SPS-VCA Adv. Topics MMedia Vid. Cod. / 5LSH0 / Module 01A Wavelets 

Introduction / Random signal

4

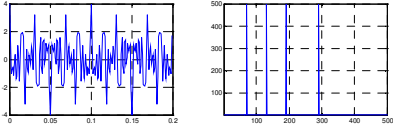

- * **A given (random) signal:**
 - Consists of low and high frequencies
 - These frequencies vary in amplitude
 - These frequencies may exist for a defined duration, so may exist only for a short amount of time or say at a given moment/location
 - Generally assumed the signal can be decomposed into a set of **basis functions**

TU/e PdW-SZ-EB / 2016 Fac. EE SPS-VCA Adv. Topics MMedia Vid. Cod. / 5LSH0 / Module 01A Wavelets 

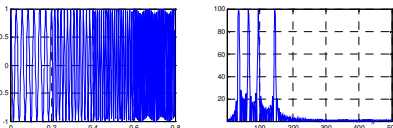

Introduction / Signal example

5

Stationary signal:
 $x = \cos(2\pi \cdot 70 \cdot t) + \cos(2\pi \cdot 130 \cdot t) + \cos(2\pi \cdot 190 \cdot t) + \cos(2\pi \cdot 290 \cdot t)$

Non-stationary signal:
 $x(t) = \cos(2\pi \cdot 35 \cdot t(1:200)) + \cos(2\pi \cdot 65 \cdot t(201:400)) + \cos(2\pi \cdot 95 \cdot t(401:600)) + x(601:800) + \cos(2\pi \cdot 145 \cdot t(601:800));$

TU/e PdW-SZ-EB / 2016 Fac. EE SPS-VCA Adv. Topics MMedia Vid. Cod. / 5LSH0 / Module 01A Wavelets 

Introduction / random signal

6

- * **For signal analysis** one would like a tool, which provides these properties:
 - Frequency
 - Amplitude
 - Location
- * **Motivation:** analysis components can be used as input for (a.o.) compression systems.
 - Which "tools" suffice?

TU/e PdW-SZ-EB / 2016 Fac. EE SPS-VCA Adv. Topics MMedia Vid. Cod. / 5LSH0 / Module 01A Wavelets 

Fourier transform

7

Fourier transform based on a signal decomposition of **sine/cosine** waves:

$$F(\omega) = \int_{-\infty}^{\infty} f(t)e^{-j\omega t} dt$$

* It has:

- Good sine wave detection/recognition
- No time-localization property
- No transient detection

* **Good tool for frequency analysis where time-localization is not important.**

Short-Time Fourier Transform (STFT) –(1)

8

* **Because:** if $f(t)$ is a **non-periodic** signal, the summation of periodic functions, sine & cosine (as with Fourier), does **not accurately** represent the signal.

* **STFT: decompose the signal $f(t)$ into pieces to achieve time-localization by means of a "window"-function**

(a.k.a. Windowed Fourier Transform)

Short-Time Fourier Transform – (2)

9

* **Short-Time:**

- Definition: $F(\omega, \tau) = \int_{-\infty}^{\infty} f(t)g(t-\tau)e^{-j\omega t} dt$

- Where $g(t)$ is a rectangular window, $g(t)=1$ for $t \in [0, T]$ and $g(t)=0$ otherwise

- Sometimes other window functions are used e.g. if $g(t)$ is Gaussian, the STFT is the Gabor transform

Short-Time Fourier Transform – (3)

10

* **Properties:**

- Able to analyze frequencies
- Able to do time-localization but...
 - The localization window is fixed! Hereby not scaling along with the (low-high) frequencies.
 - > High frequencies are (very) location precise
 - > Low frequencies are location in-precise

Short-Time Fourier Transform – (4)

11

* **Image & video coding is based on DCT**

- 8x8 video block sampling

* **2D DCT decomposition**

- for 8x8 blocks
- Figure shows basis functions
- Patterns for projections

* **However, ...**

- Block aliasing occurs

Subband coding – (1) / Fundamentals of multirate theory

12

Subband coding – (2) / M-subband Analysis/Synth. System

13

- * Analysis, low-/highpass filter pairs H_0, H_1, \dots, H_M
- * Synthesis, low-/highpass filter pairs G_0, G_1, \dots, G_M

Subband coding theory – (3) Subband Analysis/Synthesis Filters

14

- * Design of such band filters requires **great care**, they need to eliminate:

- Aliasing, which adds to (visual) distortion (due to decimation)
- Possible spectral magnitude & spectral phase **distortion**
- Constraints exist on **total full-chain response**, bandwidth suppression in certain intervals, etc.

Subband coding theory – (4) / One-dimensional filter pair (2-band)

15

- * Analysis filter magnitude responses

- * Transfer function

$$Y(z) = \frac{1}{2} [H_0(z) \cdot G_0(z) + H_1(z) \cdot G_1(z)] \cdot X(z) + \frac{1}{2} [H_0(-z) \cdot G_0(z) + H_1(-z) \cdot G_1(z)] \cdot X(-z)$$

Subband coding theory – (5) / Design Quadrature Mirror Filters (QMF)

16

- * Biorthogonality principle for perfect reconstruction

$$Y(z) = \frac{1}{2} [H_0(z) \cdot G_0(z) + H_1(z) \cdot G_1(z)] \cdot X(z) + \frac{1}{2} [H_0(-z) \cdot G_0(z) + H_1(-z) \cdot G_1(z)] \cdot X(-z)$$

- * Required: $[H_0(z) \cdot G_0(z) + H_1(z) \cdot G_1(z)] = 2 \cdot z^{-k}$

- * Alias: $[H_0(-z) \cdot G_0(z) + H_1(-z) \cdot G_1(z)] = 0$

- * When: $G_0(z) = z^k \cdot H_1(-z)$ and $G_1(z) = -z^k \cdot H_0(-z)$

Subband coding theory – (6) Quadrature Mirror Filters (QMF)

17

- * H_0 with H_1 and G_0 with G_1 are **orthogonal pairs**
since $H_1(z) = H_0(-z)$ therefore $h_1(n) = (-1)^k \cdot h_0(n)$
- * For filter coefficients, it holds (HP mirror of LP):

$$\text{i.e. } H_1(e^{j\omega}) = H_0(e^{j(\pi-\omega)})$$

$$\text{substituting } \omega = \frac{\pi}{2} - \omega$$

$$\text{hence } H_1(e^{j(\frac{\pi}{2}-\omega)}) = H_0(e^{j(\frac{\pi}{2}+\omega)})$$

- * Shows the **mirror image** property around $\pi/2$, hence H_0 and H_1 are called **QMFs**

Subband coding theory – (7) / Quadrature Mirror Filters (QMF)

18

- * **Remarks:**

- QMFs can also be designed in a **M-band** signal split setup (could of course also be done recursively with the 2-band split).

- QMFs provide **perfect reconstruction** (allowing for a given time-delay) in the filter-bank.

- However they are **not naturally good frequency cut-off** filters, which has an impact on usability for compression or other signal analysis.

Subband coding theory – (8) / Repeated decomposition

19

* Recursively applied QMF on the LP yields:

Overview of time-frequency for different decompositions

21

PdW-SZ-EB / 2016
Fac. EE SPS-VCA

 Adv. Topics MMedia Vid. Cod. /
SLSH0 / Module 01A Wavelets

Wavelets / Introduction

22

* With the STFT, the **time window remains equal** while other cycles (i.e. frequency) of the **basis function** (sine/cosine) existed in that window

* With a **wavelet basis function**, the **window size changes** while the #cycles remains equal

* Cycle and location detection are done by “scaling” and “translating” the **basis function / mother wavelet**

PdW-SZ-EB / 2016
Fac. EE SPS-VCA

 Adv. Topics MMedia Vid. Cod. /
SLSH0 / Module 01A Wavelets

Wavelets / Mother wavelet

23

* ‘Mother’ maintains its properties, derive the remaining scaled and translated wavelet functions (“psi”) by:

$$\psi_{a,b}(t) = \frac{1}{\sqrt{a}} \psi\left(\frac{t-b}{a}\right)$$

where **a** represents **scaling** and **b** represents **translation**

* **Scaling** $\frac{1}{\sqrt{a}}$ is needed to maintain “norm”

$$\|f(t)\|^2 = \int_{-\infty}^{\infty} f^2(t) dt$$

PdW-SZ-EB / 2016
Fac. EE SPS-VCA

 Adv. Topics MMedia Vid. Cod. /
SLSH0 / Module 01A Wavelets

Wavelets / Continuous functions

24

* Defining Continuous Wavelet Transform (CWT)

$$y(a,b) = \int_{-\infty}^{\infty} x(t) \cdot \psi_{a,b}(t) dt$$

* and its inverse

$$x(t) = \frac{1}{C_\psi} \int_0^{\infty} \int_{-\infty}^{\infty} \frac{1}{a^2} y(a,b) \psi_{a,b}(t) da db$$

where $C_\psi = \int_0^{\infty} \frac{|\Psi(\omega)|^2}{\omega} d\omega$ and $\Psi(\omega) = F[\psi(t)]$

as its Fourier transform

PdW-SZ-EB / 2016
Fac. EE SPS-VCA

 Adv. Topics MMedia Vid. Cod. /
SLSH0 / Module 01A Wavelets

Wavelets / Energy constraint 25

* **Needed** $\Psi(0) = 0$ for the integral to exist: $\int_{-\infty}^{\infty} \psi(t) dt = 0$

➤ Hence the wavelet function is a "specific" HP-filter, avg = 0

* **And we would like finite energy (via Parseval)**

$$\int_{-\infty}^{\infty} |\Psi(\omega)|^2 d\omega < \infty \quad \text{this happens if } |\Psi(\omega)|^2 \text{ decays}$$

when ω goes to ∞

➤ Energy now in narrow frequency band: => **frequency localization!**

TU/e PdW-SZ-EB / 2016 Fac. EE SPS-VCA Adv. Topics MMedia Vid. Cod. / SLSH0 / Module 01A Wavelets

Wavelets / Definition of Discrete WT 26

* **Discrete Wavelet Transform (DWT)**

let $a = a_0^{-m}, \quad b = n \cdot b_0 \cdot a_0^{-m}$

then $\psi_{m,n}(t) = a_0^{m/2} \cdot \psi(a_0^m t - n b_0), \quad m, n \in \mathbb{Z}$

for $a_0 = 2, \quad b_0 = 1$, we have $\psi_{m,n}(t) = 2^{m/2} \cdot \psi(2^m t - n)$

➤ Dyadic wavelets: **integer time shift and power of two scaling.**

➤ ...these are however not the only possible DWT.

TU/e PdW-SZ-EB / 2016 Fac. EE SPS-VCA Adv. Topics MMedia Vid. Cod. / SLSH0 / Module 01A Wavelets

Wavelets / Example of shifting, scaling 27

* **Example: the Haar wavelet**

$$\psi(t) = \begin{cases} 1 & 0 \leq t < \frac{1}{2} \\ -1 & \frac{1}{2} \leq t < 1 \end{cases}$$

TU/e PdW-SZ-EB / 2016 Fac. EE SPS-VCA Adv. Topics MMedia Vid. Cod. / SLSH0 / Module 01A Wavelets

Wavelets / Compare Haar & Hadamard 28

* **Haar wavelet versus the Hadamard transform**

– 2D decomposition (2x1D)

Haar wavelet

Hadamard transform

TU/e PdW-SZ-EB / 2016 Fac. EE SPS-VCA Adv. Topics MMedia Vid. Cod. / SLSH0 / Module 01A Wavelets

Wavelets / Scaling function 29

* **Scaling function** $\phi(t)$ has the property that function $f(t)$ can be represented by the scaling function, but also be represented by **dilated versions** of the scaling function ("phi")

* **Scaling function acts as the LP counterpart** of the wavelet

* **Hence: composition is phi+psi!**

TU/e PdW-SZ-EB / 2016 Fac. EE SPS-VCA Adv. Topics MMedia Vid. Cod. / SLSH0 / Module 01A Wavelets

Wavelets / 30

Multi Resolution Analysis (MRA) – (1)

* **Scaling function can also be represented by its dilations at a higher resolution (special case with half-band filters)**

$$\phi(t) = \sum_k h_k \sqrt{2} \phi(2t - k)$$

* **A.k.a. dilation equation**

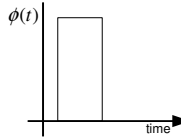

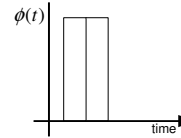

TU/e PdW-SZ-EB / 2016 Fac. EE SPS-VCA Adv. Topics MMedia Vid. Cod. / SLSH0 / Module 01A Wavelets

Wavelets /
Multi Resolution Analysis (MRA) – (2)

$\phi(t) = \sum_k h_k \sqrt{2} \phi(2t - k)$

* Does it hold for the Haar scaling function?

$$\phi(t) = \begin{cases} \frac{1}{\sqrt{2}} & 0 \leq t < 1 \\ 0 & \text{otherwise} \end{cases} \quad h_0 = h_1 = \frac{1}{\sqrt{2}}, \quad h_k = 0 \quad \text{for } k > 1$$

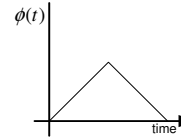

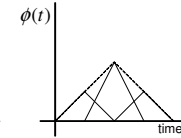

TU/e PdW-SZ-EB / 2016 Fac. EE SPS-VCA Adv. Topics MMedia Vid. Cod. / 5LSH0 / Module 01A Wavelets 

Wavelets /
Multi Resolution Analysis (MRA) – (3)

$\phi(t) = \sum_k h_k \sqrt{2} \phi(2t - k)$

* Does it hold for the Triangular scaling function?

$$h_0 = \frac{1}{2\sqrt{2}}, \quad h_1 = \frac{1}{\sqrt{2}}, \quad h_2 = \frac{1}{2\sqrt{2}}$$

TU/e PdW-SZ-EB / 2016 Fac. EE SPS-VCA Adv. Topics MMedia Vid. Cod. / 5LSH0 / Module 01A Wavelets 

Wavelets /
Scaling function, examples – (1)

* Given rules: $\sum_k h_k = \sqrt{2}$ and $\sum_k h_k^2 = 1$
(normalisation & orthogonality)

* Suppose $k=2$, $h_0 + h_1 = \sqrt{2}$
 $h_0^2 + h_1^2 = 1$

* Results in the Haar scaling function
 $h_0 = h_1 = \frac{1}{\sqrt{2}}$

TU/e PdW-SZ-EB / 2016 Fac. EE SPS-VCA Adv. Topics MMedia Vid. Cod. / 5LSH0 / Module 01A Wavelets 

Wavelets /
Scaling function, examples – (2)

* Given rules: $\sum_k h_k = \sqrt{2}$, $\sum_k h_k^2 = 1$ and $\sum_k h_k h_{k-2m} = \delta_m$
(normalisation & orthogonality, like for perfect reconstruction)

* Suppose $k=3$, $h_0 + h_1 + h_2 = \sqrt{2}$
 $h_0^2 + h_1^2 + h_2^2 = 1$
 $h_0 h_2 = 0$

* ...the two-coefficient Haar scaling function!
– In case of an odd number of coefficients, 1 coefficient will be forced zero. Thus: always an **even number** of coefficients.

TU/e PdW-SZ-EB / 2016 Fac. EE SPS-VCA Adv. Topics MMedia Vid. Cod. / 5LSH0 / Module 01A Wavelets 

Wavelets /
Scaling function, examples – (3)

* Given rules: $\sum_k h_k = \sqrt{2}$, $\sum_k h_k^2 = 1$ and $\sum_k h_k h_{k-2m} = \delta_m$
(normalisation & orthogonality, like for perfect reconstruction)

* Suppose $k=4$, $h_0 + h_1 + h_2 + h_3 = \sqrt{2}$
 $h_0^2 + h_1^2 + h_2^2 + h_3^2 = 1$
 $h_0 h_2 + h_1 h_3 = 0$

* Results: more possible solutions (Daubechies 4)...

$$h_0 = \frac{1+\sqrt{3}}{4\sqrt{2}}, \quad h_1 = \frac{3+\sqrt{3}}{4\sqrt{2}}, \quad h_2 = \frac{3-\sqrt{3}}{4\sqrt{2}}, \quad h_3 = \frac{1-\sqrt{3}}{4\sqrt{2}}$$

TU/e PdW-SZ-EB / 2016 Fac. EE SPS-VCA Adv. Topics MMedia Vid. Cod. / 5LSH0 / Module 01A Wavelets 

Wavelets /
Scaling vs. Wavelet function – (1)

* The wavelet function is **orthogonal** to the scaling function $\int \phi(t-k) \psi(t-m) dt = 0$

then $w_k = \pm(-1)^k h_{N-k}$

and $\sum_k h_k w_{n-2k} = 0$

Furthermore $\sum_k w_k = 0$

Embedded Zero-tree Wavelet (EZW)

*** Dominant pass**

- Given a threshold T
 - initially $T_0 = 2^{\lfloor \log_2 c_{\max} \rfloor}$ where c_{\max} is the largest (abs) coefficient
 - And $T_i = \frac{1}{2} \cdot T_{i-1}$ recursively
- Coefficient has a magnitude larger than T : **significant positive (sp) or significant negative (sn)**
- Coefficient has a magnitude smaller AND all its descendants have magnitudes less than T : **zerotree root (zr)**
- Coefficient has a magnitude smaller but one or more of its descendants have magnitudes larger than T : **isolated zero (iz)**
- Each indicator costing 2 bits

Wavelet coefficient coding - (5) Embedded Zero-tree Wavelet (EZW)

61

* **Example**

26	6	13	10
-7	7	6	4
4	-4	4	-3
2	-2	-2	0

* **Initial threshold (T_0) is 16**

* **First scan (upper left): sp zr zr zr** $L_s = \{26\}$
 – Encoding costs: 8 bits

TU/e PdW-SZ-EB / 2016 Adv. Topics MMedia Vid. Cod. /
 Fac. EE SPS-VCA SLSH0 / Module 01A Wavelets

Wavelet coefficient coding - (6) Embedded Zero-tree Wavelet (EZW)

62

* **Refinement pass, $1.5 \times 16 = 24$**

- $26 - 24 = 2$ hence positive
- Encoding cost 9 bits

* **Reconstruction incl. refinement,**
 – Correction is $T_0 / 4 = 4$

Wavelet coefficient coding – (8) Set Partitioning In Hierarchical Trees (SPIHT)

64

* **Invented by A. Said & W. Pearlman, 1996**
 – offering improved coding performance over EZW

* **Main idea: a multi-pass (recursive) “tree” algorithm is equal to EZW.**
 – It stops when a constraint is met (e.g. exhausted bit-budget)

* **In each step the following 3 lists are managed (in order of execution):**

1. List of Insignificant Pixels (LIP)
2. List of Insignificant Sets (LIS)
3. List of Significant Pixels (LSP)

 Fac. EE SPS-VCA SLSH0 / Module 01A Wavelets

Wavelet coefficient coding – (9) Set Partitioning In Hierarchical Trees (SPIHT)

65

* **Possible Sets (or Trees) are:**

- D :set of descendants with insignificant children
- L :set of descendants with significance (not in LIS since recognition of D suffices)

* **Significance depending on threshold: $T_i = 2^{n_i}$ where**
 $n_0 = \lfloor \log_2 c_{\max} \rfloor$ and $n_i = n_{i-1} - 1$ (eff. bitplane coding)

* **Initialization:**

- LIP: root nodes
- LIS: root sets, except top
- LSP: empty

Wavelets conclusions / Complexity & coding aspects

73

	DCT	Wavelets
Computational	+ (low)	+ (low)
Memory	+ (8x8 blocks)	-- (complete frame)
Perceptual quality	-- (blocking)	+ (smoothness)

Wavelets / Concluding remarks

74

* Only an introduction

- to the mathematical background & reasons of wavelets and its processing techniques
- on intraframe coding, more in JPEG2000
- on interframe wavelet compression issues
 - much recent work in this field
- on signal analysis, e.g. for noise reduction
 - often its quality rivals traditional methods
